

DIESEL TREATMENT AR

For the lubrication of car and truck diesel fuel systems.

Application:

For all diesel engines with common-rail and pump-nozzle technology. Add contents of can to the fuel tank. At least 10 liters of diesel fuel should be present in the tank here. 300 mL are sufficient for 70 liters of diesel fuel. We recommend use every 2,000 km and as a preventive measure after each repair of the injection system and the engine.

Features:

Prevents deposit formation in the combustion chamber and injection system. Diesel Treatment AR increases the lubrication effect of low-sulphur fuel and thus prevents surface wear, which in turn prevents the risk of failure of the injection system. The storage stability of biodiesel fuels is also extended. Compatible with all modern diesel-oxidation catalytic converters.

Increase in the lubrication capability of the diesel fuel

- Increase in the service life of moving parts of the diesel system
- Minimal risk of failure of the injection system

Ensures precise diesel injection

- Lower fuel consumption
- Smooth engine running

Prevents deposit formation

Reduction in pollutant emissions

No sulphur, phosphorous, metal or acid
